SiteProof

System, Domain & Implementation Reference

Revision 3 — Safety-Led, with Injury-on-Duty Claims

Prepared for: Lisan Al-Gaib, Self Hawk Tech (Pty) Ltd **Date:** 22 September 2026 **Supersedes:** Implementation & Domain Reference (Rev 1), Feature Specification (Rev 1), Safety-Led Reference (Rev 2)

What changed in Revision 3

1. A new module: injury-on-duty (IOD) claim lifecycle management. Rev 2 treated injury reporting as a single event — capture the incident, file the W.Cl.2 within seven days. That understated it badly. A COIDA claim is a months-long document chase across up to six forms, several parties and a monthly reporting cadence, and the Commissioner only closes a case and makes final payment once every form has been submitted. The chase is the pain, and it is now specified in full in section 2.5.

2. A correction to my own data-protection rule. Rev 2 said: store the fact of a medical certificate, never its contents. That rule cannot survive the IOD module, because first and progress medical reports *are* clinical documents and the employer is legally obliged to handle them. Section 2.9 now sets out the lawful basis under POPIA section 32 and the **Health Information Regulations that came into force on 27 February 2026** — which apply to employers and their operators, and SiteProof would be an operator.

3. Payments move from Paystack to Stitch (primary) or Peach Payments. Section 1.7 compares them. The short version: Stitch supports DebiCheck and debit orders natively with automatic fallback between methods; Peach is card-tokenisation-first and leaves the subscription logic to you. For contractors who pay by debit order, Stitch is the better fit. Either way, you build a provider-agnostic billing layer.

4. A complete feature inventory is now included as Appendix A — every feature in the system, by module, with its phase.

What changed in Revision 2 (carried forward)

Safety leads, claims follow. Claims are episodic; safety is daily. Daily use builds habit, habit prevents churn, and daily safety capture generates the photographic record the claims module depends on. *Safety is the door. Claims is the till.*

The COIDA insurer correction. Construction employers are usually insured with the Federated Employers Mutual Assurance Company (FEM), not the Compensation Fund. FEM is one of two private companies licensed to provide COIDA cover and focuses on building and construction; employers fully insured with FEM do not register with the Fund, and FEM issues the Letter of Good Standing used for site access and tenders. Sources: FEM, Tenderkom, South African Builder, ClearComply.

How to read this document

Marker	Phase	Meaning
P1	Safety wedge	Daily safety capture, incident capture, evidence, safety file. Adoption.
P2	Claims spine	IOD claim lifecycle, EOT notice engine. The commercial payoff.
P3	Multi-party	Principal contractor tier, additional contract forms, variations.
P4	Depth	Year two. Programme analysis, grading evidence, AI.

On verification. Every legal and regulatory statement was checked against a source at the time of writing, and sources are linked. That is not the same as being correct today. Rev 1 contained a factual error about which body issues Letters of Good Standing to construction contractors; Rev 2 contained a data-protection rule that Rev 3 has had to revise. Treat

every statement here with the same suspicion, and verify at source before writing code that depends on it.

This is not legal advice. Before any of this becomes software that affects a contractor's money, their statutory position or their workers' health information, have it reviewed by a construction attorney, a quantity surveyor, a SACPCMP-registered practitioner and a privacy practitioner.

PART 1 — STRATEGIC POSITION

1.1 The product in one sentence

> ***A South African contractor's site records — safety, injuries, progress and evidence — captured once on a phone and turned into what actually protects them: a defensible safety file, injury claims that get paid, and delay claims that were notified in time.***

1.2 Why safety leads

	Safety	Claims
Frequency of use	Every working day	A handful of events per project
Buyer motivation	Legally mandated, already budgeted	Discretionary
Habit formation	Strong	None
Evidence density	Built continuously	Needed only at claim time

The data argument is the decisive one. The claims modules only work if a dense, dated, photographic record already exists when something goes wrong. You cannot retrofit that. Daily safety capture builds it as a side effect, so by the time the first delay or injury occurs, months of records are already in the system.

The distribution argument. The principal contractor's exposure for subcontractor safety is immediate, personal and statutory — a far easier first conversation than "you may be losing claims."

1.3 Where the IOD module fits

The injury-on-duty lifecycle is arguably a better lead for Phase 2 than the EOT notice engine, for one reason: **it recovers money the contractor is already owed**, rather than money they might recover. An employer carries compensation for the first three months and medical costs paid upfront, and reclaims them only when the claim closes. A dashboard line reading "*R14,200 owed to you on open injury claims*" turns a compliance chore into a cash-flow tool.

It also reuses almost everything built in Phase 1: the incident capture, the worker register, the attendance record, the deadline engine and the document vault.

1.4 The trap to avoid

SafetyCulture — free tier, vast template library, already used in South Africa, and better at generic checklists-with-photos than you will be in year one. If you position as "a safety checklist app," you lose.

Generic tool	SiteProof
Blank template builder	Pre-mapped to the Construction Regulations
Generic inspection records	Appointments register, s37(2) agreements, Regulation 4 notifications
An incident form	A COIDA claim tracked from W.Cl.2 to W.Cl.6, with money owed shown
Export a PDF	A safety file in the order a DEL inspector expects
Photos in an app	Hash-chained, integrity-sealed evidence
Safety data stays in the safety tool	Safety photos are also claim evidence

1.5 Positioning

Say: *the system that keeps South African contractors compliant, gets their injury claims paid, and stops them losing delay claims — built for JBCC, COIDA and the Construction Regulations.*

Never say: *safety checklist app, photo documentation app, digital transformation, all-in-one construction platform.*

1.6 Who buys it

Buyer	Hook	Verdict
Subcontractor principal (CIDB 2–5, 6–40 people)	Cannot produce a safety file on demand; LGS lapses; injury claims stall; loses EOT claims	The right end user, the wrong first customer
Principal contractor	Statutorily exposed for sub compliance; chases it over WhatsApp	**The right buyer.** Pays, and can mandate it onto subs
CHSO / safety consultant (SACPCMP-registered)	Their whole job is this paperwork, done manually across 10–20 clients	**The right first conversation, and a distribution channel**

Sequence: learn from the CHSO, sell to the principal contractor, serve the subcontractor.

1.7 Pricing and payments

Tiers

Tier	Indicative	Who	Core
Site	R249–R399/mo	Solo, one active site	Safety checklists, diary, photos, incidents, safety file
Contractor	R699–R999/mo	Multi-site sub	+ IOD claim lifecycle, EOT notice engine, statutory vault
Principal Contractor	R2,500–R6,000/mo per active site	Main contractor	+ sub accounts, compliance rollup, s37(2) register

Per **active site**, not per user, for the PC tier. Free subcontractor seats under a paying PC are the growth loop.

Payment provider: Stitch (primary) or Peach Payments

The deciding requirement is **debit order**. It is the dominant SMB recurring instrument in South Africa, and card-on-file churn from expired cards and insufficient funds is severe at these ticket sizes.

	Stitch	Peach Payments
Recurring model	Mandate-based: DebiCheck, debit order, card, Pay by bank, Capitec Pay VRP	Card tokenisation
DebiCheck	Supported natively	Not found in their recurring documentation — verify directly
Failed-payment handling	Automated fallback retry via an alternative method	Your code
Subscription logic	Mandate/consent management provided; billing schedule is yours	"Business logic needs to be coded by a developer" for API integrations
API style	GraphQL, OAuth 2.0 client credentials	REST, with mobile SDKs
Operational note	DebiCheck collections run over an SFTP-based file exchange	Standard card API

Stitch supports every mandated recurring payment method in South Africa including DebiCheck, with automated fallback logic retrying failed payments via an alternative method (Stitch recurring payments). It supports debit order and DebiCheck through a single integration alongside card, Pay by bank, Capitec Pay VRP and manual EFT, with mandates set up via pre-built flows or API and bank account verification built in (Stitch on debit orders and DebiCheck). A DebiCheck mandate is created as a Payment Consent Request; the customer authorises it and it moves to GRANTED, after which collections can be initiated against the consent ID (Stitch DebiCheck integration docs). The collection process itself runs over an SFTP-based file-sharing protocol (Stitch DebiCheck introduction) — plan for that operationally, because it is not a simple request/response API.

Peach Payments handles recurring billing through secure card tokenisation that lets subsequent subscription payments bypass 3D Secure, but for an API or SDK integration the subscription business logic has to be coded by the developer (Peach recurring billing). Cards must be tokenised with customer permission before recurring collection (Peach developer docs). Peach is a strong card gateway; it is the weaker fit for a debit-order-first product.

Recommendation: Stitch as the primary provider, with **DebiCheck as the default method and card as the fallback**. Keep Peach as an option if you want a card-only path or a second provider for redundancy.

Build a provider-agnostic billing layer regardless

Neither provider runs your billing engine for you. You own plans, proration, dunning, invoicing and entitlements. Design it so the provider is an adapter:

```
billing_plans          id, code, name, price_cents, interval, per_site
subscriptions          id, org_id, plan_id, status, current_period_start,
                       current_period_end, active_sites, cancel_at
payment_mandates       id, org_id, provider, provider_mandate_id,
                       method, status, authorised_at, revoked_at
invoices               id, org_id, subscription_id, number, period,
                       subtotal_cents, vat_cents, total_cents, status
payment_attempts       id, invoice_id, mandate_id, provider,
                       provider_ref, amount_cents, status,
                       failure_reason, attempted_at, next_retry_at
```

```
type PaymentProvider interface {
    CreateMandate(ctx context.Context, req MandateRequest) (Mandate, error)
    Collect(ctx context.Context, mandateID string, amountCents int64, ref string) (Attempt, error)
    RevokeMandate(ctx context.Context, mandateID, reason string) error
    ParseWebhook(r *http.Request) (Event, error)
}
```

This keeps a provider switch — which you are making now — from ever touching business logic again. **Before implementing either adapter, read the provider's current API reference and webhook payload schemas directly; do not build from this summary.**

Invoices must be VAT-compliant if you are VAT-registered, and **annual prepay at a discount** suits contractors who budget per project.

1.8 What to validate first

Twelve weeks, no production code.

Weeks 1–4 — learn. Read the Construction Regulations 2014 in full, the JBCC advisory notes on extension of time, and the Labour Guide COIDA claims guide end to end.

Weeks 4–8 — three CHSOs. "Show me the last safety file you assembled — how long did it take?" "Which documents do you chase most?" "How many clients do you carry?" "Who pays for the safety file?"

Weeks 8–10 — five subcontractors. Ask to see a real site diary. Then: "Tell me about the last injury on one of your sites. How long did the claim take to close? Did you get your money back?" That last question tests the IOD thesis directly.

Weeks 10–12 — three principal contractors. *Do you pay for your subs' compliance tooling, or require them to?*

Exit signal: a CHSO says they would put their whole client base on it.

PART 2 — THE SAFETY DOMAIN

2.1 The statutory stack

Occupational Health and Safety Act 85 of 1993 (OHSA) — the parent statute. Section 24 governs reportable incidents; section 37(2) governs mandatary agreements, which allocate liability between employer and contractor and have no international equivalent.

Construction Regulations 2014 — the documentation spine of the safety module. Full text (PDF) · ASAQS annotated guidelines (PDF) · Master Builders guidelines (PDF)

COIDA 130 of 1993 — injury compensation, the claim forms, and the Letter of Good Standing.

POPIA 4 of 2013 and the **2026 Health Information Regulations** — what you may store about workers, and how.

2.2 Regulations 3 and 4

Regulation 3 — construction work permit. As published, required at or above thirteen million rand or CIDB grade 6 (Polity); raised by exemption notice to above forty million rand for work starting on or after 7 February 2017 (Labour Guide, SAIOSH). Where required, the client must appoint a SACPCMP-registered agent.

Regulation 4 — notification of construction work. For all other construction work, the contractor must notify the provincial director **at least 7 days before** work begins (Regulation 4). Your users live here: project created → notification due in seven days → form generated → submission tracked.

Store thresholds as data, never as constants. They have already moved once.

2.3 The safety module

2.3.1 Checklists `P1`

Ships pre-mapped to the Construction Regulations, not as a blank builder.

The principle that matters most: photo mandatory on a fail, optional on a pass. A tick-box list proves nothing. A photograph on every non-compliance, with mitigation and a close-out photograph, is what demonstrates active risk management.

```
checklist_templates   id, org_id, name, regulation_ref, frequency,
                      applies_to_activity, is_system_template, version
checklist_items       id, template_id, sort_order, text, guidance_text,
                      reference_photo_id, response_type,
                      photo_required_on_fail, photo_required_always,
                      severity, triggers_corrective_action
checklist_instances   id, template_id, template_version, project_id,
                      performed_by, performed_at_device,
                      performed_at_server, lat, lng, status
checklist_responses   id, instance_id, item_id, response, comment,
                      photo_ids[], corrective_action_id
```

`reference_photo_id` — a photograph showing what "correct" looks like. Training embedded in the workflow, and a real differentiator.

Template versioning is non-negotiable. A checklist completed in 2027 must be reproducible in 2030 exactly as worded then.

2.3.2 Corrective action register `P1`

Every fail generates a corrective action with an owner, due date and severity. It stays open until a close-out photograph and verification are recorded. **Open-items ageing is the best single safety metric** and the one a principal contractor will judge subcontractors on.

2.3.3 Housekeeping `P1`

A scored walk by zone with a photograph per zone, trended over time. Among the most commonly cited inspection categories, a leading indicator of incidents, the easiest thing to photograph meaningfully, and a reason for the foreman to open the app on a day when nothing is wrong. **The trend line is the product.**

Zones worth including: material stacking, waste and rubble, access routes, edge protection, offcuts and nails, cable and hose management, spill containment, welfare facilities, signage, tool storage.

2.3.4 Toolbox talks P1

Topic, presenter, duration, attendance by scan or signature, photograph. **Ships with a content library** — foremen will not write safety content.

2.3.5 Hazard identification P1

Hazard, location, risk rating before and after, mitigation, owner, close-out date, before and after photographs. The most valuable field for regulatory purposes.

2.3.6 PPE compliance and issue register P1

Required items per activity, worn confirmed, non-compliances against named workers, and an issue register proving PPE was actually handed out.

2.3.7 Risk assessments P1

Baseline and activity-specific, versioned, with review dates. Starting an activity without a current assessment is flagged.

2.3.8 Appointments register P1

Construction manager, construction supervisor and competent-person appointments. Expiry alerting, generated appointment letters, and **gap detection** — an activity underway with no corresponding appointment.

2.3.9 Section 37(2) mandatary agreements P1

Register per contractor, generated agreement, signature capture. The clearest local-specificity signal you can show a principal contractor.

2.3.10 Safety file assembly P1

The feature a CHSO will pay for on its own. A day's work reduced to ninety seconds, in the order an inspector expects: statutory documents and Letter of Good Standing, appointments, H&S plan and specification, risk assessments, method statements, s37(2) agreements, inductions, medical certificate status, competencies, toolbox talks, inspections, incident register, emergency procedures, PPE register. Generated asynchronously and versioned.

2.3.11 Inspection readiness view P1

Traffic-light per project: what exists, what is missing, what has expired.

2.4 Incidents — the three reporting paths

A workplace injury triggers **three distinct obligations**. Most tools handle one.

Path A — COIDA, to the insurer. Report within **7 days** of receiving notice of the accident, on **W.Cl.2**. Failure is an offence under section 39(6). The duty applies even where the employer believes the injury did not arise in the course of employment (Bowmans, Labour Guide). For construction, submission usually goes to FEM rather than the Compensation Fund.

Path B — OHSA section 24, to the regulator. Incidents causing death, unconsciousness or disablement are reportable to the Department of Employment and Labour on the prescribed Annexure 1 form (MAKROSAFE).

Path C — internal. An investigation is required under OHSA with findings recorded in an incident register (Gawie le Roux Institute).

The product captures once and serves all three. The foreman records the incident on site; the system determines which obligations are triggered, starts the clocks, pre-fills the forms and maintains the register.

Near misses get a one-tap, thirty-second, no-blame entry. The near-miss-to-incident ratio is a metric both principal contractors and insurers understand.

2.5 Injury-on-duty claim lifecycle P1 / P2

2.5.1 The problem

Filing the W.Cl.2 is the start, not the end. A COIDA claim runs for weeks or months, involves the employer, the injured employee, one or more treating doctors and the insurer, and requires a sequence of forms that must all arrive before the case closes. **Only after every form has been submitted will the Commissioner make all payments and close the case** (Labour Guide).

The failure mode is not a missed first form. It is a missing progress report in month three that stalls the claim indefinitely while nobody notices.

2.5.2 The form sequence (injury)

Form	Name	Who completes	When
W.Cl.2	Employer's Report of an Accident	Employer (Part A); Part B detached and sent with the employee to the doctor	Within 7 days
W.Cl.3	Employee's Report of an Accident	Employee, where able	With the claim
W.Cl.4	First Medical Report	Treating doctor	First consultation; obtain without delay if not sent with the W.Cl.2
W.Cl.55 / W.Cl.56	Acknowledgement / acceptance card	The Fund	W.Cl.56 when liability is accepted; W.Cl.55 when it cannot yet be; both carry the claim number
W.Cl.5	Progress Medical Report	Treating doctor	**Monthly** during prolonged absence
W.Cl.5	Final Medical Report (same form)	Treating doctor	When fit to return, or permanently disabled
W.Cl.6	Resumption Report	Employer	When the employee returns to work, submitted with the final W.Cl.5

Sources: Labour Guide claims guide, Labour Guide claiming procedure, Pay Solutions, Evergreen Accounting.

Supplementary forms for specific injuries include W.Cl.31 (hand), W.Cl.221 (foot), W.Cl.52 (eyes), plus W.Cl.46 (burial expense account) for fatalities and **W.G.29 (objection against a decision of the Commissioner)** (Compensation Fund Assistance form list).

Occupational diseases follow a separate path: W.Cl.1 and W.Cl.14 reported within 14 days of diagnosis, W.Cl.22 first medical report, W.Cl.26 progress and final reports, and W.Cl.110 exposure history (EOHCB on the disease sequence). Construction exposures — silica dust, noise, vibration — make this path relevant, and the exposure history is exactly the data the attendance and risk-assessment records already hold.

2.5.3 The money

The employer is liable for compensation for the first three months from the date of injury, and one purpose of the W.Cl.6 resumption report is to let the employer reclaim what it paid during that period (Labour Guide, Bowmans). Employers also frequently pay medical costs upfront to get an injured worker treated and are reimbursed later.

That makes an open, stalled claim a **receivable**, not merely a compliance item.

2.5.4 The boundary: you run the process, the portal receives it

Submission goes into the Compensation Fund's CompEasy system (compeasy.labour.gov.za, per Evergreen Accounting) or into FEM's own claims process. **I have not found evidence of a public API for either.** Design on the assumption that you cannot file programmatically: the product prepares everything, the employer uploads it, the system records the reference.

Ask FEM directly whether an integration route exists. For a construction-focused product, a FEM integration would be a genuine moat.

2.5.5 Features

#	Feature	Phase
1	**Pre-filled W.Cl.2 Part A** from the site incident entry, worker register and organisation profile	P1

2	**Part B as a handout** — PDF the foreman can WhatsApp or print for the treating doctor, so the worker is not turned away	P1
3	**7-day clock** on the shared deadline engine, escalating to the owner	P1
4	**Claim stage tracker** — reported, acknowledged, liability accepted, in treatment, final report received, resumed, closed	P2
5	**Document checklist per claim** — W.Cl.3, W.Cl.4, ID copy, payslip or proof of earnings, witness statements, invoices — with status and ageing	P2
6	**Doctor intake without an account** — a secure, expiring upload link for the practice; or the foreman photographs the report	P2
7	**Monthly W.Cl.5 cadence** — automatic reminders for as long as the worker is off	P2
8	**Claim number capture** from the W.Cl.55/56 card, photographed or typed	P2
9	**W.Cl.6 triggered by attendance** — when the injured worker clocks in again, the system prompts the resumption report	P2
10	**Light duties tracking** — the resumption report asks whether light duties were offered and performed (W.Cl.6 form outline)	P2
11	**Reimbursement tracker** — compensation paid in the first three months plus medical costs paid upfront, per claim and in total, shown as money owed	P2
12	**Submission pack export** — every document for the claim, ordered for upload to CompEasy or FEM, with a manifest	P2
13	**Complete immutable archive** — employers are advised to keep copies of every form because documents have been lost by the Commission before (Bowmans)	P2
14	**Objection tracking** — W.G.29 against a Commissioner's decision, with its own deadline once verified	P3
15	**Occupational disease path** — W.Cl.1/14/22/26 and exposure history assembled from attendance and risk records	P3
16	**Fatality path** — W.Cl.46 and dependant documentation, handled with appropriate care in the UI	P3

Feature 9 is the one only an integrated product can offer. A standalone claims tool has no idea when the worker came back. SiteProof does, because the foreman scanned them in at the gate.

2.5.6 Data model

```
iod_claims              id, org_id, project_id, incident_id, worker_id,
                        claim_type,       -- injury | disease | fatality
                        insurer,          -- fem | compensation_fund | rma
                        claim_number, stage, reported_at,
                        liability_status, date_off_work,
                        date_resumed, light_duties_offered,
                        light_duties_performed, closed_at

iod_claim_documents     id, claim_id, doc_type,  -- wcl2 | wcl3 | wcl4 | wcl5
                                                 -- | wcl6 | id_copy | payslip
                                                 -- | witness | invoice | other
                        status, due_at, received_at, source,
                        file_id, is_health_data, uploaded_by

iod_claim_ledger        id, claim_id, entry_type, -- comp_paid | medical_paid
                                                  -- | reimbursed
                        amount_cents, entry_date, reference, note

iod_claim_events        id, claim_id, event_type, occurred_at, actor, detail
```

The `is_health_data` flag drives encryption, access control and logging — see 2.9.

2.5.7 What the product does not do

It does not decide liability, advise on compensation amounts, or submit on the employer's behalf. It prepares, tracks and chases. The employer remains the reporting party.

2.6 The Letter of Good Standing

For construction, usually issued by **FEM**; otherwise by the Compensation Fund. The vault needs an `issuer` field — different portals, renewal cycles and reference formats — and onboarding should ask which insurer the contractor uses.

It is a **gating document**: without a current one a subcontractor can be barred from site and blocked from payment. Expiry alerts at 60, 30 and 7 days and an annual Return of Earnings reminder are unglamorous features with a direct

line to money, and an excellent free-tier hook.

2.7 Medical certificates of fitness

Regulation 7(8) requires every employee to hold a valid medical certificate of fitness specific to the construction work, issued by an occupational health practitioner on **Annexure 3** (Annexure 3 (PDF), Annexure 3 text). Valid for **one year** (example (PDF)). The employer completes the job-specific sections — occupation, exposures, job requirements, protective clothing — before the examination.

Features: expiry tracking per worker with a block on clock-in when lapsed; pre-filling the employer's section of Annexure 3 from the worker's trade and the project's risk assessment. A CIDB standard for primary health assessments exists and does not replace the statutory certificate (CIDB standard (PDF)).

2.8 Workers and attendance

Two records, two tables. Diary headcount (counts by trade and subcontractor, claim evidence) and clock-in (per named worker, compliance and incident context).

Clock-in is foreman-driven. Worker carries a QR or NFC card; the foreman scans at the gate; roll-call fallback. Offline, cheap, no fixed hardware.

Buddy-punching controls: geofence check, server timestamp, and a reconciliation flag when scanned count differs from the diary headcount.

Attendance events are append-only. Corrections are new rows referencing the original. Attendance may be the only evidence of whether a worker was on site when injured — and in Rev 3 it also drives the W.Cl.6 prompt.

Export for payroll; do not become payroll.

2.9 POPIA and the 2026 Health Information Regulations — revised

2.9.1 The baseline prohibition

Section 26 prohibits processing special personal information — including **health** and **biometric** information — unless an exception in sections 27 to 33 applies (POPIA s26).

2.9.2 The employer exception

Section 32(1)(f) authorises **administrative bodies, pension funds, employers or institutions working for them** to process health information where necessary for implementing laws or collective agreements that create rights dependent on the data subject's health, or for **the reintegration of or support for workers entitled to benefit in connection with sickness or work incapacity**. Section 32(2) adds that such information may only be processed subject to an **obligation of confidentiality** — by virtue of office, employment, profession, legal provision, or written agreement (POPIA s32, ASISA guidelines (PDF)).

COIDA claims fall squarely within the purpose of that exception. That is the lawful basis for the IOD module to hold medical reports.

2.9.3 The 2026 Health Information Regulations

The *Regulations relating to the Processing of Data Subjects' Health Information by Certain Responsible Parties, 2026* were published in Government Gazette No. 54268 and signed on 27 February 2026. They operationalise section 32(6), came into force on publication with **no grace period**, and apply to eight categories of responsible party **and their operators — including employers** (ITLawCo, Labour Guide).

The final text dropped several of the draft's more onerous requirements, including a mandatory Legitimate Interest Assessment and detailed cross-border transfer notification provisions (Bowmans, Mayet & Associates).

Commentary disagrees on how far the regulations reach. One analysis of the draft noted the scope had narrowed to employers *working for administrative bodies or pension funds* (Moonstone); later commentary on the final text describes employers as a significant inclusion. **Read the gazetted regulations themselves and have a privacy practitioner confirm whether they apply to your customers and to you as operator.** Design as though they do.

2.9.4 The revised rules

Rule 1 — no biometrics. Ever. Unchanged. QR and NFC do the job.

Rule 2 — medical certificates of fitness: status, not contents. Unchanged. Store existence, issue and expiry dates, practitioner practice number, fit / fit-with-conditions / unfit, and the employer-declared exposures. Not findings, diagnoses or restrictions.

Rule 3 — new — IOD medical reports are health data held under section 32(1)(f), and treated as the most sensitive data in the system:

Control	Requirement
Purpose limitation	Used only for the specific COIDA claim. Never surfaced in safety analytics, dashboards or reports
Encryption	Separate KMS key from all other data, including other evidence
Access	A named **claims handler** role only. Not the foreman after capture, not the CHSO by default, **never** a principal contractor
Confidentiality	Your operator agreement must impose the section 32(2) confidentiality obligation, and customers should confirm their handlers are bound by one
Logging	Every view, download and share recorded, with purpose
Retention	Defined and published; tied to claim closure plus a statutory period confirmed by a practitioner
Minimisation	Structured fields capture what the claim needs; clinical detail stays in the document, not in queryable columns

Rule 4 — other personal information. ID numbers encrypted under a separate key, last four digits displayed, full view gated. Evidence in af-south-1. Operator agreement in your terms. Do not auto-purge worker or attendance records.

Regulator: Information Regulator of South Africa.

PART 3 — DELAY CLAIMS AND EVIDENCE

3.1 The thesis

> ***A South African subcontractor loses money not because they cannot prove what happened, but because they missed a contractual notice deadline and had no contemporaneous record to attach when they finally submitted.***

3.2 Vocabulary

Use	Not
Site diary	Daily log
Contract instruction (CI)	Change order
Variation	Change order (cost)
Extension of time / revision of the date for practical completion	Schedule extension
Principal agent	Project manager
Employer (JBCC) / Client (Construction Regulations)	Owner
Principal contractor	General contractor
Practical completion	Substantial completion
Snag list	Punch list
Preliminaries and generals	General conditions
Bill of quantities	Schedule of values

The Construction Regulations **agent** and the JBCC **principal agent** are different appointments under different instruments.

3.3 The JBCC notice regime

Clock A — notice of intention. Within **20 working days** of becoming aware, or when the contractor ought reasonably to have become aware, of a potential delay. Failure makes the claim unenforceable regardless of merit (Cox Yeats, Hahn & Hahn).

Clock B — quantification. 40 working days from being able to quantify the delay to submit the claim and calculation (JBCC EOT advisory note (PDF), Le Roux Consulting).

Clock C — the principal agent. 20 working days to respond; silence means **deemed rejection**, opening the notice of disagreement (Agora Africa, JBCC advisory note 23.0 (PDF)).

Subcontracts run tighter — the Series 2000 Ed 5.0 subcontract required notice within 15 working days (Lexology). Clause numbers above are Edition 6.2; verify the current edition.

3.4 Entitlement, quantum, evidence

Successful claims establish **entitlement** through timeous notice, **quantify** against the critical path, and rest on **contemporaneous documents** (Le Roux Consulting). The third is what Phase 1 safety capture builds.

3.5 Weather

Adverse weather is a clause 23.1.1 event, with no onus to prove it was exceptional (SciELO) — but rain alone is not grounds; the effect is (advisory note 23.0).

Record **effect, not condition**: activities stopped, hours lost, critical-path flag, and a **delayed-effect flag** for ground

still waterlogged days later. Under GCC, abnormality is judged against foreseeable rainfall records for the area (Lexology); baselines must be regional (regional patterns, Plumbing Africa).

3.6 Site diary

Two-tier: Tier 1 in sixty seconds (date, crew, weather, work, photos); Tier 2 escalates when something is flagged claimable. Record **labour by trade and subcontractor**, **plant working versus standing**, **materials expected but not received**, instructions received, and drawings and revisions received.

3.7 Confirmation of verbal instruction P2

Who instructed, what, when, witnesses → formal CVI letter to the principal agent with delivery evidence. The highest value-to-effort feature on the claims side. Lead demos with it.

3.8 Claim state machine

```
POTENTIAL_DELAY_IDENTIFIED — Clock A ➔ NOTICE_SENT ➔ CLAIM_SUBMITTED — Clock C ➔
  GRANTED_FULL | GRANTED_PARTIAL | REJECTED | DEEMED_REJECTED ➔ DISAGREEMENT ➔ DISPUTE

Failure states:  NOTICE_LAPSED (Clock A)   CLAIM_LAPSED (Clock B)
```

`NOTICE_LAPSED` is loud and escalated to the owner. `DEEMED_REJECTED` is a defined outcome, not an error.

3.9 Notices go out by email

The principal agent is not your customer and will not log in. Notices are formal PDFs **sent from the contractor's own verified domain**, with the exact bytes, message ID, delivery and open events stored. Record the method, because some contracts require registered post or hand delivery. The short notice of intention and the heavy submission are **two separate documents**.

3.10 Evidence integrity

Build to the factors in section 15 of the Electronic Communications and Transactions Act 25 of 2002 — reliability of generation, storage and integrity maintenance. **Read section 15 at source.**

Dual timestamps · SHA-256 at capture · per-project hash chain · daily signed anchor · device attestation (Play Integrity, App Attest) · mock-location flagging · immutable originals · append-only access log.

Never say "tamper-proof" or "court-admissible."

3.11 Programme charts

Separate **rendering** (P2, layout maths) from **critical-path calculation** (P4, a scheduling engine). Server-side SVG in Go serves both web and PDF identically. Non-working days shade from the same calendar table as the deadline engine. Bar labels auto-place with collision fallback; callouts are user-dragged and stored. The chart presents what was entered and footers the method and data date. Read the Society of Construction Law Delay and Disruption Protocol before building impacted views.

PART 4 — SYSTEM DESIGN AND STACK

4.1 Domain model

```
organisation (tenant)
  ├── users, roles, capability flags
  ├── billing: plans, subscriptions, mandates, invoices, attempts
  ├── statutory_documents (issuer: fem | compensation_fund | …)
  ├── workers ── credentials ── medical_certificates (status only)
  └── projects
        ├── contract, project_parties
        ├── SAFETY SPINE (P1, daily)
        │     checklists, housekeeping, toolbox talks, hazards,
        │     corrective actions, appointments, risk assessments,
        │     attendance_events (append-only), incidents
        ├── IOD SPINE (P1 capture, P2 lifecycle)
        │     iod_claims ── documents (health-flagged) ── ledger ── events
        ├── diary_entries, photos (hash-chained)
        ├── DELAY CLAIMS SPINE (P2)
        │     claims ── deadlines ── events ── generated documents
        ├── contract_instructions ── variations
        └── programmes, reports, safety_files
```

All spines share `photos` and `evidence_links`. One photograph can serve a housekeeping walk, a hazard, an injury claim and a delay claim.

4.2 The shared deadline engine

Application	Period	Basis
EOT notice of intention	20 working days	From awareness
EOT claim submission	40 working days	From quantifiability
Principal agent response	20 working days	From receipt
COIDA W.Cl.2	**7 days**	From notice of accident
W.Cl.5 progress reports	**Monthly, recurring**	While employee off work
Disease notification	**14 days**	From diagnosis
Regulation 4 notification	7 days	Before work starts

Plus expiry tracking on Letters of Good Standing, medical certificates, competencies, appointments, insurances and risk assessment reviews.

Must handle: weekends; public holidays (1 Jan, 21 Mar, 27 Apr, 1 May, 16 Jun, 9 Aug, 24 Sep, 16 Dec, 25 Dec, 26 Dec, plus Good Friday and Family Day); the Sunday-to-Monday rule; proclaimed ad hoc holidays; and the **project's builders' holiday** from contract data. Calendar days and working days must be distinguished per rule — the COIDA periods are stated in days, the JBCC periods in working days. **The calendar is a table, not a constant.**

Liability protection: show the rule and calendar, let users inspect excluded days, never present a deadline as authoritative, log every computation, and alert on **job non-completion**, not just failure.

4.3 Stack

Keep: Go (Gin, pgx), PostgreSQL, Expo/React Native, Next.js, S3 in af-south-1 with Object Lock, Redis, JWT with refresh rotation, GitHub Actions with ECR, SES.

Change: payments move to **Stitch** (primary) or **Peach Payments**, behind the `PaymentProvider` interface in section 1.7. Stitch's API is GraphQL with OAuth 2.0 client credentials and its DebiCheck collections involve an SFTP file exchange — budget integration time accordingly.

Cut for now: Python AI services, event bus, gRPC, microservices, OpenTelemetry, OIDC. **Biometrics permanently.**

What transfers from existing work: offline-first SQLite manifest and delta sync, JWT auth, the flag-based permission model, QR/NFC and HMAC primitives for worker cards and evidence chains, document verification flows, SAST handling, push notifications, Docker Compose deployment, k6 load testing, and the lesson that ingress rather than the

Go backend was the bottleneck — so route media direct to S3 via presigned multipart.

4.4 Offline

Client-generated UUIDs · separate metadata and media queues · resumable chunked uploads · **WiFi-preferred by default** with an explicit "upload now on data" button and size estimate · on-device compression to a 2048px long edge before hashing · local storage budget with loud warnings · per-record sync status · append-only where possible, hard lock on anything linked to a submitted claim or closed safety file.

4.5 Roles

Role	Scope	Capabilities
Foreman / site agent	Assigned projects	Checklists, housekeeping, toolbox talks, hazards, near misses, incidents, attendance, diary, photos. Flags claims. **Cannot send notices. No access to IOD medical documents after capture.**
Contracts manager / QS	Assigned projects	Delay claims, notices, programmes
Safety officer / CHSO	Assigned projects	All safety records, appointments, safety file, worker register. Read-only on delay claims. **IOD medical documents only if granted the claims-handler capability.**
Claims handler (new)	Organisation	IOD claims including health-flagged documents, ledger, submission packs
Organisation owner	All	Everything; billing; users. Health documents via claims-handler capability, logged
Bookkeeper	Financial	Invoices, variation and claim values, **IOD reimbursement ledger totals** — never medical documents
Principal contractor	Their site, cross-org	Subs' compliance, open actions, housekeeping trends, claims served on them. **Never subs' draft claims. Never subs' workers' health information.**
Principal agent / employer	Single project	No account. Email and expiring read-only links.
Treating doctor / practice	Single IOD claim	No account. Expiring upload-only link.

4.6 Phase plan

Phase 0 — Validation (weeks 1–12)

No production code. Read, interview, decide the buyer. **Exit:** a CHSO would put their client base on it.

Phase 1 — Safety wedge (weeks 12–28)

Organisations, users, projects, roles · checklists with Construction Regulations library, photo-on-fail, reference photos · corrective actions · housekeeping · toolbox talks · hazards · near misses · **incident capture across all three reporting paths** · **pre-filled W.Cl.2 with Part B handout and 7-day clock** · appointments with gap detection · s37(2) register · worker register, credentials, MCoF status and expiry · QR/NFC attendance · statutory vault with FEM and Compensation Fund issuers · Regulation 4 notification · hash-chained photos · two-tier diary · **safety file assembly** · inspection readiness · offline throughout · **Stitch subscriptions (DebiCheck with card fallback)**.

Exit: a CHSO runs their client base on it, or a PC mandates it on a site.

Phase 2 — Claims spine (weeks 28–46)

IOD claim lifecycle — stage tracker, document checklist, doctor upload links, monthly W.Cl.5 cadence, claim number capture, attendance-triggered W.Cl.6, light duties, reimbursement ledger, submission packs · delay claims register · three-clock state machine · notice generation and proof of service · CVI · evidence linking · quantum entry · claim submission pack · programme chart rendering · dispute pack.

Exit: a contractor recovers IOD money they would otherwise have written off, or says the notice clock saved a claim.

Phase 3 — Multi-party (weeks 46–66)

PC tier and free sub seats · compliance rollup · incoming claim tracker · external read-only links · GCC and NEC · variations · rainfall baselines · IOD objections, disease path and fatality path.

Phase 4 — Depth (year 2+)

Programme import and critical-path linkage · CIDB grading evidence · accounting integration · analytics · FEM integration if an API exists · only then AI.

4.7 Security

TLS with HSTS · encryption at rest with customer-managed keys — **separate keys for evidence, application data, and health data** · S3 Object Lock on evidence · no public object URLs · append-only audit log shipped off-instance · ID numbers and health documents under gated access · secrets in a managed store · payment webhooks signature-verified and idempotent · **alert on deadline-job non-completion** · tested quarterly restore.

PART 5 — RESOURCE LIBRARY

5.1 Read these first

1. **Construction Regulations 2014 (PDF)** — the spine of the safety module.
2. **Labour Guide — Guide in respect of COIDA claims** — the full injury claim sequence, W.Cl.2 through W.Cl.6, including the three-month employer liability. The spine of the IOD module.
3. **JBCC Advisory Note on Extension of Time (PDF)** — the spine of the delay claims module.
4. **POPIA section 32** and **the 2026 Health Information Regulations explained** — what you may do with workers' health information.

5.2 Health and safety law

- Construction Regulations 2014 — full text (PDF)
- ASAQS annotated guidelines (PDF)
- Master Builders guidelines (PDF)
- Regulation 4 — Notification of construction work
- Polity — New Construction Regulations 2014
- Labour Guide — permit exemption notice · SAIOSH notice
- CIFA — impact on clients and designers (PDF)
- DEL construction inspection presentation (PDF)
- PolicyVault — Construction Regulations 2014
- Department of Employment and Labour · Labour Guide · SAIOSH

5.3 COIDA injury and disease claims

- Labour Guide — Guide in respect of claims — W.Cl.4 follow-up, monthly W.Cl.5, W.Cl.6 with final report, W.Cl.55/56 cards, three-month liability
- Labour Guide — Claiming procedure for injuries on duty — step-by-step W.Cl.2, Part A and Part B
- Labour Guide — COID form downloads — W.Cl.1 through W.Cl.26 and the basic guides
- Compensation Fund Assistance — full COIDA form list — including supplementary injury forms and W.G.29 objections
- Bowmans — step-by-step guide to correctly submitted injury claims — section 39, the duty to report even when disputed, and why to keep copies
- Pay Solutions — COIDA claiming procedures
- Evergreen Accounting — how to claim from COIDA — a worked example including CompEasy upload and reimbursement
- EOHCB — employer obligations when reporting
- EOHCB — sequence of events for occupational diseases — W.Cl.1, 14, 22, 26 and the 14-day window
- HR Spot — reporting an injury on duty
- Gawie le Roux Institute — the law on injury on duty
- MAKROSAFE — incident reporting and OHSA section 24
- CK Law — workplace injuries and COIDA
- W.Cl.6 resumption report outline
- CompEasy · CF Online · Return of Earnings

5.4 FEM and the Letter of Good Standing

- FEM · FEM — benefits to the construction industry
- South African Builder — workers' compensation simplified
- Tenderkom — COIDA registration and LGS
- ClearComply — COIDA registration and LGS 2026

- OurPower — COIDA registration

5.5 Medical certificates of fitness

- Annexure 3 with regulation 7(8) (PDF) · Annexure 3 text
- Annexure 3 worked example (PDF)
- Occupational Health Southern Africa — MCoF (PDF)
- CIDB Standard for Primary Health Assessments (PDF)
- Care Net Consultants — construction medicals

5.6 Data protection and health information

- Information Regulator of South Africa
- POPIA full text · Section 26 · Section 32
- ITLawCo — POPIA health data regulations 2026 — gazette reference, commencement, who is covered
- Bowmans — Health Information Regulations cross the finish line — what changed from the draft
- Labour Guide — what employers must know
- Mayet & Associates — new POPIA regulations on health information
- Moonstone — legal experts on the draft regulations — the scope debate
- Labour Guide — draft regulations and section 32(f)
- ASISA POPIA guidelines (PDF) — section 32 and the confidentiality obligation
- Usercentrics — POPIA overview

For **ECTA**, read section 15 of the Electronic Communications and Transactions Act 25 of 2002 at source.

5.7 Contracts and delay claims

- JBCC · EOT advisory note (PDF) · Advisory note 23.0 (PDF)
- Cox Yeats · Hahn & Hahn · Le Roux Consulting · Agora Africa
- Lexology — JBCC subcontract EOT · Lexology — GCC weather
- SciELO — claim events under the JBCC PBA
- SAICE · NEC · FIDIC · Society of Construction Law
- **Book:** *Construction Delay Analysis Simplified — The South African Edition*, Dr Hendrik Prinsloo
- Weather: Plumbing Africa · Long International · SA regional rainfall · SA Weather Service

5.8 Industry bodies

- CIDB · Register of Contractors · Registers Service · Registration guide (PDF) · Grade 2–9 application (PDF)
- SACPCMP — your distribution channel
- ASAQS · Master Builders South Africa · SASOHN

5.9 Payments

Stitch

- Stitch — recurring payments and debit order collections
- Stitch — debit orders and DebiCheck guide
- Stitch — DebiCheck overview
- Stitch docs — DebiCheck introduction — mandate then collection; SFTP-based collection process
- Stitch docs — DebiCheck integration process — Payment Consent Requests, GraphQL endpoint, client token scope
- Stitch docs — Capitec Pay recurring consents — including consent revocation on cancellation
- TechCabal — Capitec and Stitch launch VRP

Peach Payments

- Peach — subscription and recurring billing
- Peach — subscription and recurring payment options
- Peach developer docs — recurring payments · Documentation hub

5.10 Competitors

- OVS Solutions — safety software in SA · GoAudits roundup · Capterra SA
- CompanyCam pricing 2026 · Raken review

5.11 Technical

- Go · pgx · PostgreSQL · Row-level security · Redis
- Expo · expo-sqlite · expo-file-system · expo-location · expo-task-manager · SQLite
- S3 multipart · Presigned URLs · Object Lock · Lifecycle · AWS pricing calculator
- Play Integrity · App Attest · RFC 3161
- SES event publishing · OWASP ASVS · SVG 2

PART 6 — RISKS AND CAVEATS

6.1 The biggest risk is attention

You already run TicketHawk solo, with live production work and new programmes underway. A second vertical SaaS is a decision about where your only scarce resource goes. **Phase 0 costs evenings, not your business** — do it before committing.

6.2 Specific risks

Risk	Severity	Mitigation
Deadline engine gives wrong advice	**Severe**	Professional review; conservative alerts; show workings; never authoritative; log everything
Mishandling workers' IOD medical reports	**Severe**	s32(1)(f) basis confirmed by a practitioner; separate key; claims-handler role only; never visible to PCs; full logging
Health Information Regulations apply to you as operator in ways not yet understood	**High**	Read the gazetted text; privacy practitioner review before Phase 2
Building biometrics	High	Cut permanently
Positioning as a safety checklist app	High	Compete on statutory specificity
DebiCheck integration complexity (SFTP collections)	Medium	Budget time; card fallback from day one; provider-agnostic billing layer
No submission API at FEM or CompEasy	Medium	Design for manual upload; ask FEM directly
Contract editions renumber	High	Version contract forms
Thresholds and form numbers change	Medium	Store as data; monitor
Assuming the Compensation Fund where construction uses FEM	Medium	Support both issuers
Distribution	High	CHSO channel and PC-led model; test both in Phase 0
Storage cost	Medium	Lifecycle tiering; never promise "unlimited"

6.3 What this document is not

Not legal advice, not a specification, and not a substitute for people who have spent careers in this industry. Two earlier revisions each contained something that had to be corrected. Before any of it becomes code that affects money, statutory standing or health information, have it reviewed by a **construction attorney**, a **quantity surveyor**, a **SACPCMP-registered CHSO**, a **COIDA practitioner or FEM account manager**, and a **privacy practitioner**.

APPENDIX A — COMPLETE FEATURE INVENTORY

Every feature in the system, by module. **P1** safety wedge · **P2** claims spine · **P3** multi-party · **P4** depth · ✕ deliberately excluded.

A.1 Platform foundation

Feature	Phase	What it does
Organisation accounts	P1	Tenant record: registration, VAT, CIDB grading, logo, default contract form, COIDA insurer
User accounts	P1	Email/password, bcrypt, JWT with refresh rotation
Device session management	P1	View and revoke sessions — a lost foreman's phone must be revocable
Phone-number invitations	P1	SMS deep-link invites; many foremen have no work email
Roles and capability flags	P1	Role sets defaults; flags grant or revoke individual capabilities
Project scoping	P1	Users see only assigned projects
Onboarding wizard	P1	First project, contract form, insurer, principal agent, foreman invite — under five minutes
Organisation settings	P2	Defaults, notification preferences, branding, retention
Multi-organisation membership	P2	One login across several companies, fully isolated contexts

A.2 Projects and contract setup

Feature	Phase	What it does
Project record	P1	Site, GPS boundary, value, dates, contract and revised completion dates
Party register	P1	Employer, PA, QS, PC, subs, CR agent, CHSO, with notice-recipient flags
Multi-site portfolio	P1	All projects with deadlines, compliance status, days since last diary
Contract form — JBCC	P2	Versioned by edition; drives notice rules and vocabulary
Contract data capture	P2	Penalties, builders' holiday, working-day definition, notice method
Notice addressee validation	P2	Warns if a notice is about to go to the wrong party
Project close-out	P2	Read-only lock, evidence chain sealed, storage tiering
Contract forms — GCC, NEC, FIDIC, bespoke	P3	Additional notice regimes
Project templates	P3	Clone parties and settings from a previous job

A.3 Safety

Feature	Phase	What it does
Construction Regulations checklist library	P1	Pre-mapped templates, versioned
Photo mandatory on fail	P1	Non-compliance cannot be recorded without evidence
Reference photos per item	P1	Shows what "correct" looks like; training in the workflow
Checklist scheduling	P1	Daily, weekly, per-activity, ad hoc
Custom checklist builder	P2	Organisation-specific templates on top of the library
Corrective action register	P1	Owner, due date, severity, before/after photos, close-out verification
Open-items ageing	P1	Visible ageing and escalation of overdue actions
Housekeeping walks	P1	Zone scoring with photos
Housekeeping trends	P1	Per-site trend lines over time

Toolbox talks	P1	Topic, presenter, attendance by scan or signature, photo
Toolbox talk content library	P1	Pre-written talks by activity and season
Hazard identification	P1	Location, risk before/after, mitigation, photos
Near-miss one-tap capture	P1	Thirty-second, no-blame entry
PPE compliance checks	P1	Required items, worn confirmed, named non-compliances
PPE issue register	P1	Proof of what was issued, to whom, when
Risk assessments	P1	Baseline and activity-specific, versioned, review dates
Activity-without-assessment flag	P1	Warns when work starts with no current assessment
Appointments register	P1	Written appointments with expiry and supersession
Appointment letter generation	P1	Templates per appointment type
Appointment gap detection	P1	Activity underway with no corresponding appointment
Section 37(2) agreements	P1	Register, generated agreement, signature capture
Regulation 4 notification	P1	7-day deadline, form generation, acknowledgement tracking
Construction work permit tracking	P3	For projects above the threshold
H&S plan and specification storage	P1	Versioned with acknowledgements
Activity-specific plans	P3	Fall protection, excavation, lifting, traffic, emergency
Induction records	P1	Who, when, by whom, on which content version
Safety file assembly	P1	Complete file in inspector order, generated asynchronously
Inspection readiness view	P1	Traffic-light: present, missing, expired

A.4 Incidents

Feature	Phase	What it does
Incident capture	P1	Type, worker, injury, body part, treatment, witnesses, photos, sketch
Reporting-path determination	P1	Flags COIDA, OHSA s24 and internal obligations from one entry
OHSA s24 reportable incident flow	P1	Annexure 1 preparation and tracking
Incident register	P1	Statutory internal register maintained automatically
Incident investigation	P2	Root cause, contributing factors, corrective actions
Lessons-learned distribution	P3	Share findings across sites

A.5 Injury-on-duty claims

Feature	Phase	What it does
Pre-filled W.Cl.2 Part A	P1	From incident, worker register and organisation profile
Part B handout	P1	PDF for the treating doctor, shareable by WhatsApp or print
7-day W.Cl.2 clock	P1	Shared deadline engine, escalating to owner
Insurer routing	P1	FEM or Compensation Fund, from organisation profile
Claim stage tracker	P2	Reported → acknowledged → accepted → in treatment → final → resumed → closed
Document checklist per claim	P2	W.Cl.3, W.Cl.4, ID, earnings proof, witnesses, invoices, with ageing
Doctor upload link	P2	Account-free, expiring, upload-only
Monthly W.Cl.5 cadence	P2	Recurring reminders while the worker is off
Claim number capture	P2	From the W.Cl.55/56 card

Attendance-triggered W.Cl.6	P2	Worker clocks in again → resumption report prompted
Light duties tracking	P2	Offered and performed, as the W.Cl.6 requires
Reimbursement ledger	P2	Three-month compensation and medical costs paid, shown as money owed
Submission pack export	P2	Ordered documents and manifest for CompEasy or FEM upload
Immutable claim archive	P2	Every form and version retained
Claims-handler role	P2	Only role with access to health-flagged documents
Objection tracking (W.G.29)	P3	Once the objection period is verified
Occupational disease path	P3	W.Cl.1/14/22/26 with exposure history from site records
Fatality path	P3	W.Cl.46 and dependant documentation
FEM integration	P4	Only if an API exists

A.6 Workers and attendance

Feature	Phase	What it does
Worker register	P1	Name, encrypted ID, trade, employer, photo
Worker credentials	P1	Competencies and licences with expiry
Medical certificate of fitness tracking	P1	Status and expiry only
Annexure 3 employer-section pre-fill	P2	From trade and risk assessment
Clock-in block on lapsed MCoF	P1	Prevents an uncertified worker being clocked in
QR/NFC worker cards	P1	Foreman scans at the gate, offline
Roll-call fallback	P1	Tap names from the assigned list
Geofence check	P1	Scan location against site boundary
Headcount reconciliation flag	P1	Scanned count vs diary headcount
Append-only attendance	P1	Corrections as new rows
Worker project assignment	P1	Induction required before clock-in
Attendance reporting	P2	Registers, hours, absence patterns
Payroll export	P2	Export only — never payroll
Biometric attendance	×	Prohibited category under POPIA s26

A.7 Statutory documents

Feature	Phase	What it does
Organisation document vault	P1	LGS, CIDB, tax, insurances, B-BBEE, bargaining council
Issuer-aware LGS	P1	FEM, Compensation Fund or other
Expiry alerting	P1	60, 30 and 7 days
Annual filing reminders	P1	Return of Earnings, renewals
Verification status	P2	Uploaded → verified → expired → rejected
Share to principal contractor	P3	Prove compliance once, not per PC
CIDB grading evidence pack	P4	Completed-project evidence; verify requirements first

A.8 Site diary

Feature	Phase	What it does
Two-tier entry	P1	Sixty-second default, escalation when claimable
Weather with effect	P1	Activities stopped, hours lost, critical path, delayed effect
Manual weather readings	P1	Rainfall mm, temperature, wind
Labour by trade and subcontractor	P1	Hours worked and standing
Plant working vs standing	P1	Recoverable standing time
Materials delivered	P1	With delivery note photo
Materials expected not received	P1	A delay ground in itself
Work completed	P1	By area, with auto-suggest
Instructions received	P1	Written or verbal, links to CVI
Delays with claimable flag	P1	Starts the notice clock in P2
Revision history and lock	P1	Locked once linked to a submitted claim
Diary search and export	P1	By date, trade, flag, keyword
Diary reminders	P1	End-of-day push
Automatic weather fetch	P2	Cross-check only
Drawings and revisions received	P2	Receipt dates as claim triggers
Visitors to site	P2	Name, organisation, purpose, times
Signature and countersignature	P2	Site agent and PC representative
Missing-day detection	P2	Flags gaps before opposing counsel does
Rainfall baseline comparison	P3	Regional or contractual baseline

A.9 Evidence

Feature	Phase	What it does
In-app camera with GPS	P1	Location, device time, project, user, device
On-device compression	P1	2048px long edge before hashing
SHA-256 at capture	P1	Re-verified server-side
Dual timestamps	P1	Device and server, divergence shown
Per-project hash chain	P1	Insertion or deletion detectable
Immutable originals	P1	Markup and watermarks are derived files
Markup and annotation	P1	Separate layer
Watermarking	P1	Company, project, contract ref, date, GPS
Tagging and galleries	P1	Progress, defect, safety, delay, and more
Access log	P1	Every view, export, share
Daily signed chain anchor	P2	Separate append-only store
Device attestation	P2	Play Integrity and App Attest
Mock-location flagging	P2	Recorded, not discarded
Before/after pairing	P2	Defects and remediation
Video, voice notes, document scanning	P2	Same integrity treatment
Evidence export pack	P2	Hash manifest and chain verification

A.10 Delay claims

Feature	Phase	What it does
Claims register	P2	Reference, type, status, clocks, value at risk
Claim from diary entry	P2	One tap, evidence carried
Clause lookup	P2	Edition-aware, shown before citing
Three-clock state machine	P2	Notice, submission, PA response, deemed rejection
Working-day calculator	P2	Holidays, Sunday rule, Easter, builders' holiday
Calendar inspector	P2	Shows excluded days and why
Deadline recomputation log	P2	Audit trail of what the system said and when
Escalating alerts	P2	T−10 to T+1, up to the owner
Notice generation	P2	Letterhead, clause, recipient, evidence
Email dispatch from customer domain	P2	With stored bytes and delivery proof
Alternative service recording	P2	Registered post or hand delivery
Evidence linking	P2	Many-to-many with relevance notes
Quantum entry	P2	Days and itemised cost
Confirmation of verbal instruction	P2	Formal CVI letter with proof
Contract instruction register	P2	CI number, issuer, dates
Claim outcome recording	P2	Granted, partial, rejected, deemed rejected
Claim submission pack	P2	Narrative, extracts, photos, calculation, correspondence
Programme chart rendering	P2	As-planned vs as-built, server-side SVG
Dispute pack	P2	Handover to QS or attorney
Inbound correspondence threading	P2	PA replies attached to the claim
Claims dashboard	P2	Value at risk, days claimed vs granted, PA response times
Variation valuation and register	P3	Itemised, running total against contract value
Critical-path calculation	P4	Dependencies, float, automatic impact
Programme import	P4	MS Project, Primavera, CSV

A.11 Principal contractor tier

Feature	Phase	What it does
Per-site licence with free sub seats	P3	The growth loop
Compliance rollup dashboard	P3	Per site, across all subs
Sub document status board	P3	LGS, insurances, CIDB, s37(2)
Housekeeping comparison across subs	P3	Trends side by side
Incoming claim tracker	P3	Claims served on the PC with response clocks
Visibility boundary screen	P3	Shows subs exactly what the PC can see
Cross-site portfolio	P3	For PCs running multiple sites
External read-only links	P3	PA and employer, expiring, no account

A.12 Reports

Feature	Phase	What it does
Daily site report	P1	Branded, for the PA or client
Custom date-range reports	P1	For claims, disputes, requests
Customer branding	P1	Their letterhead, not yours
Template versioning	P1	Reproducible years later
Weekly and monthly reports	P2	Aggregated with photo selection
Scheduled delivery	P2	Automatic Friday report

A.13 Offline and sync

Feature	Phase	What it does
Full offline capture	P1	All site functions without signal
Client-generated UUIDs	P1	Idempotent sync
Separate metadata and media queues	P1	Records reach the server before photos
Resumable multipart uploads	P1	Resume, not restart
WiFi-preferred with data override	P1	Size estimate before using mobile data
Local storage budget	P1	Loud warnings before the queue fills
Per-record sync status	P1	Users can see their evidence is safe
Background upload	P1	Where the OS permits

A.14 Notifications

Feature	Phase	What it does
Push, email, in-app	P1	Deadlines, expiries, assignments, incidents, sync failures
Escalation rules	P1	Unacknowledged critical alerts go up the hierarchy
SMS for critical deadlines	P2	Paid add-on
Digests and quiet hours	P2	Summaries; respect site working hours

A.15 Billing

Feature	Phase	What it does
Stitch DebiCheck mandates	P1	Default recurring method
Card fallback	P1	Automatic when a debit fails
Provider-agnostic billing layer	P1	Plans, subscriptions, invoices, attempts behind an interface
VAT-compliant invoices	P1	Downloadable
Annual prepay	P1	Discounted
Dunning and retry schedule	P1	Failed collections retried and escalated
Mandate revocation on cancel	P1	Consent revoked so no further collection is possible
Per-active-site billing	P3	PC tier, prorated
Free read-only tier on lapse	P2	Evidence stays readable; writes need a subscription
Usage visibility	P2	Storage, sites, seats against plan

Peach Payments adapter	P3	Optional second provider or card-only path

A.16 Security and audit

Feature	Phase	What it does
Tenant isolation	P1	Data-layer `org_id` plus PostgreSQL row-level security
Separate encryption keys	P1	Evidence, application data, health data
S3 Object Lock	P1	Evidence cannot be deleted
Presigned short-lived URLs only	P1	No public objects
Append-only audit log	P1	Shipped off-instance
Rate limiting	P1	Auth and evidence endpoints
Signed, idempotent payment webhooks	P1	No double-processing
Deadline-job non-completion alerting	P1	A silently stopped job is a business-ending defect
Tested quarterly restore	P1	Backups proven, not assumed
Data export on request	P2	POPIA rights; removes lock-in objection

A.17 Deliberately excluded

Feature	Why
Face recognition and biometric attendance	POPIA s26 prohibited category; QR/NFC does the job
Storing medical certificate contents	Status and expiry are all compliance needs
AI PPE detection and progress comparison	Research projects; P4 at the earliest
Estimating, invoicing, job costing, payroll, scheduling	Where the incumbents are going; abandons your moat
Filing COIDA claims on the employer's behalf	The employer is the reporting party; you prepare and track
Running adjudication or arbitration	You prepare the pack; the contractor's advisers act

A.18 Phase totals

Phase	Features listed	Exit criterion
P1	110	A CHSO runs their client base on it, or a PC mandates it
P2	62	A contractor recovers IOD money, or the notice clock saves a claim
P3	21	A principal contractor pays for a site licence
P4	4	Only once P1–P3 generate revenue

Phase 1 is now much larger than in earlier revisions because safety leads. That is the plan's main execution risk. If Phase 1 has to shrink, keep checklists with photo-on-fail, corrective actions, incidents with the W.Cl.2 clock, the worker register with attendance, the statutory vault, offline capture and the safety file — and defer housekeeping trends, appointments gap detection and the s37(2) register to early Phase 2.

Revision 3, compiled 22 September 2026. Supersedes Revisions 1 and 2. Sources verified at time of writing and linked throughout. Verify at source before relying on any threshold, deadline, form number, clause reference or payment API.
